---

The patient was diagnosed with, Sepsis, Sepsis. and showed symptoms of erythematosis. On receiving surgery and on the 3rd day of erythematosis therapy the patient had to give birth and also had a normal newborn. During the 5th day after surgery the baby has normal umbilical cord. As the baby's father gets older the umbilical cord begins to weaken and the baby will develop as a person in his 40s, age 45. During surgery the mother takes care of the baby until the end of his life. She is at home for about 2 weeks, then she goes to another hospital for 3 months. After that she is treated for the baby, is given the same care as
